Timothy Strain Trials

Timothy trials were as follows:

Trial	Year Seeded	Location	Remarks
1. Timothy Strain Trial	1952	Guelph	Seeded alone and with red clover. Growth average. Completed.
2. Timothy Strain Trial	1953	Guelph	Pure Stand. High yields, severe lodging.
3. Timothy Strain Trial	1953	Kemptville	Co-operative with D.L. Parks.
4. Timothy Strain Trial	1954	Hespeler	Fox sand, low yields. Drought thinned stands severely in 1955. No aftermath.

Alfalfa

Strain Trials

B.E. Twamley

R.P.O.: F.H. 10-14

Year Initiated: 1953.

1953-1954 Seedings

The yields of both hay and aftermath in experiments conducted over a period of 2 - 3 years at Guelph, Kemptville, Hespeler and Lynn are shown in the accompanying table. These tests are being continued and are being supplemented by an additional one at Guelph. Vernal, DuPuits and Narragansett are in the lead in yield production but the lead is not pronounced.

Very considerable varietal differences were found in winter hardiness at Guelph. This is shown in the accompanying table along with data on height in spring and fall.

	Height in inches:		Winter-kill percentage Apr. 22, 1955	Yield tons/acre 1955
	Apr. 21 1954	Oct. 20 1955		
Vernal	2-3	6	3	6.5
Grimm	1-2	5	6	5.6
Ranger	2-3	6-7	11	6.2
Narragansett	1-2	6	3	6.7
Du Puits	3-4	12	45	6.3
Ladak	1-2	3	5	5.7
Rhizoma	1-2	4	4	5.7
Ont. Varieg.	1-2	5	7	5.7

Grimm	2.7	4.4	2.5 2.1 4.6

\* trials at Guelph, Hespeler, Kemptville, Lynn.

Alfalfa Strain Trial, Kemptville, 1953.

Tons D.M. /Ac.

	Hay	Aftermath 1	Aftermath 2	Aftermath Total	Total	Lynn Hay 1955
Vernal	2.97	1.05	1.47	2.52	5.49	1.40
Grimm	2.61	1.14	1.29	2.43	5.04	0.99
Ranger	2.62	1.15	1.36	2.51	5.13	1.26
Narragansett	2.78	1.04	1.50	2.54	5.32	1.24
Du Puits	2.72	1.26	1.50	2.76	5.48	1.16
Ladak	2.87	0.90	1.24	2.14	5.01	1.44
Rhizoma	2.74	1.16	1.40	2.56	5.30	1.03

It is seen that although Du Puits suffered very heavy damage and Ranger considerable damage there was no apparent effect on yield.

1955 Seedings

R.P.O.: F.H. 10-13.

Year Initiated: 1955.

A new seeding was established on section 16C. It consisted of 16 strains replicated four times in a randomized block design. The light companion crop of oats was harvested before maturity, irrigation was provided and the seedlings were cut back on Sept. 2. Establishment was good. A list of the varieties used follows:

Ont. Var.	Buffalo	Narragansett	Du Puits
Rhizoma	Ranger	A 225	Socheville
Ladak	Vernal	A 226	Danish
Grimm	Atlantic	de la Yona	Caliverde

Nurseries

R.P.O.: F.H. 10-14

Year Initiated: 1955

The plants selected in 1954 from the selection nursery on 8B were vegetatively propagated and transplanted to 1A. The parent plant and two good cuttings were used for each clone,

Alfalfa Management

B.E. Twamley

R.P.O.: F.H. 10-7

Year Initiated: 1954

The history of this experiment during 1955 was as follows:

March 19. Commercial fertilizer applied by hand.

April 11. Farmyard manure applied.

F<sub>1</sub>: - 0

F<sub>2</sub>: - 8 - 10 tons per acre. Composition approximately 10-5-10.

F<sub>3</sub>: - 116 lb. per acre of 60% muriate of potash = 1 lb. per plot.

F<sub>4</sub>: - 174 lb. per acre of 20% superphosphate - 1½ lb. per plot

F<sub>5</sub>: - F<sub>3</sub> + F<sub>4</sub>

F<sub>6</sub>: - 2(F<sub>3</sub> + F<sub>4</sub>)

June	Cut 1	Oct. 7	Cut 3
------	-------	--------	-------

Sept. 2	Cut 2	Nov. 11	Cut 4
---------	-------	---------	-------

April 22	Stand counts
----------	--------------

July 25	" "
---------	-----

Sept. 13	Fertilizer applied as on April 11.
----------	------------------------------------

The yield in this experiment was low. The rather light soil combined with the dry summer were probably the limiting factors. At the time of the October cutting the Grimm and Vernal plots were about 4" high, the Ranger plots about 5" and the DuPuits plots 6". No weights were taken for this cutting which included only one third of the plots. Very little growth occurred between Oct. 7 and Nov. 11. Weights were taken on replicate 1 only on Nov. 11. The dry weights ranged from about 40 lbs. per acre to about 700 and averaged about 160 lb. They are presumed to correspond fairly

closely with those that would have been obtained if the Oct. 7 cutting had been weighed.

In the accompanying table some data are given on yields and stands.

Alfalfa Management Study

Red Clover Screening Trial

R.P.O.: F.H. 10-2

B. E. Twamley  
Year Initiated: 1953

The purpose of this experiment was to test out under Ontario conditions varieties of red clover of red clover of foreign origin and unnamed local strains against improved Canadian varieties.

The group included nine American, three English and five Canadian varieties as well as Ontario grown commercial seed and two selected strains originating at the O.A.C. It was seeded on May 9, 1953 on 18C as a randomized block with four replicates under a light cover crop of oats. The latter were removed in June. Very satisfactory stands were obtained.

The plots were harvested twice in 1954 and in June 1955. Data obtained on earliness, longevity and disease resistance as well as on yield are shown in the accompanying tables.

Comments:

The English group - Dorset Marl, English Broad, Essex Late.

Inferior to practically all North American strains in hay yield, aftermath and longevity.

The American group

Pennscott - a high yielding early biennial type excelling in production in the first harvest year both for hay and for aftermath. Unfortunately there are but few plants left for the second harvest year. It is susceptible to mildew and to anthracnose.

Wisconsin - The Wisconsin "1/100 Acre" strain performed very well in yield, longevity and disease resistance. The "Mildew-Resistant" strain, although outstanding in resistance to mildew was mediocre

Common Sel.		Common Sel.	Essex Late
Redon		Wegener	Dorset Marl
Leon			

in other respects. The strain labelled "Composite was a mixture of the above two strains.

Kenland and Midland - Mediocre in yield, longevity, and showing only a limited resistance to anthracnose and mildew.

Emerson - comparable to Pennscott.

Wegener, Cumberland - below average in yield, longevity and disease resistance.

O.A.C. Selections - Common Selection showed good yield potential but rather poor longevity. While very susceptible to mildew it was quite resistant to anthracnose. The Delaware Selection showed considerably less promise.

Commercial - In yield and longevity the showing made was very poor. See Comments in the Regional Strain Trials.

The Canadian group - Some very encouraging results were obtained in this group. Leon, however, was below average. For notes on Dollard, Ottawa, Lasalle and Redon refer to the Regional Strain Trials.

General Conclusion (based only on this test)

- A. The varieties considered worthy of further testing are: Dolard, Ottawa, Lasalle, Redon, Pennscott, Wisconsin.
- B. Varieties appearing to be unworthy of further testing are: English varieties, Midland, Cumberland, Wegener, Delaware, Leon.
- C. Borderline cases: Emerson, Common Selection, Kenland.

Rod Clover Regional Strain Trials

R.P.O.: F.H. 10-3

Year Initiated: 1953, 1954

For a description of these tests and for data collected previously see the 1954 issue of Progress Report, Forage Crop Investigations. The tables that are presented in the present report include some of these data as well as data collected in 1955.

Discussion

Yield:- No one variety is consistently superior to any other one over the entire province or indeed in any particular area. As an example the two lowest yielding strains in the hay harvest of the plots seeded at Guelph in 1953 were the two top yielding ones of the trials seeded in 1954.

The two items that show a relatively high degree of consistency are, first, that aftermath yields of Redon are low and second, that second year harvest yields of commercial red clover are low.

The variable results obtained with Redon and with commercial seed may be attributed in part at least to variability in seed lots.

Comments:

The aftermath growth was so little that weights were not taken.

Seedings in 1955

R.P.O.: F.H. 10-15, 16, 17.      Year Initiated: 1955

Three strain trials and one observational plot were seeded in section 16C. The strain trials were laid down in four replicates according to a randomized block design. A list of varieties follows.

10-15 Double cut type - 14 strains.

Pennscott	Bogle I	Wisconsin Mildew Resistant
Emerson	Bogle II	Wisconsin Polycross
Lasalle	Redon	Commercial I
Dollard	Purdue	Commercial II
Ottawa		Kenland

10-16 Single cut type - 7 strains

Mammoth	Thomas	N. Ontario I
Redon	Leon	N. Ontario II
Alaskland		

10-17 Redon - 7 strains

Idaho 1952	Brampton 1953 - second cut
Dunbar 1954	Brampton 1954 - first cut
Commercial	Brampton 1954 - early second cut
	Brampton 1954 - late second cut

The observational section consisted of 30 European strains or varieties including a number from Russia. Two replicates were sown for most strains and the plots were about 5' x 5'.

All seedings were made with a light cover crop of oats which were cut before maturity. The plots were irrigated during the summer and were cut back about Sept. 1. Establishment in general was good but a few plots were somewhat patchy. Some washing occurred at the lower side of the field.

#### Red Clover Nurseries

Three types of nurseries were established on 9D and two at the Isolation Farm.

1. Polycross nursery, 9D, using plants selected in 1954 from the nursery on 8B.
2. Clonal reserve nursery, 9D, for parental plants selected in 1954 from 8B.
3. Selection nursery 9D, of about 2600 plants of the varieties La salle, Pennscott and Commercial.
4. Increase and selection nursery, de Vos farm. The variety was Common Selection, a strain developed by Dr. McConkey. About 500 plants were planted.
5. Nectar and seed study, de Vos farm. About a dozen clones with 3-8 plants each were planted.

White Clover

B.E. Twamley

Strain Trials

R.P.O.: F.H. 10-11

Year Initiated: 1954

The white clover - ladino strain trial established on section 17D in 1954 suffered considerable damage during the winter of 1954-5. Two factors contributed. Some strains were not winter-hardy while many of the strains were damaged by ice cover which was the result of randomly distributed numerous small topographical irregularities. Variability within strains was thus very great.

Volunteer grasses invaded all plot but especially the less competitive strain. Morso and Lodi were particularly susceptible to this invasion. Separations were made where necessary in the yield trials.

In the accompanying tables the yields for the four cuttings are shown along with estimates of winter-kill.

Nurseries

R.P.O.: F.H. 10-19

Year Initiated: 1955

A selection nursery of about 300 individually spaced plants was set out on section 9D. Very heavy damage was caused by white grub attacks, mortality in some rows being over 30%. The varieties used were:

Pilgrim (Pennsylvania)

S100 (Aberystwyth)

POC 3 (Quebec)

Lodi (Denmark)

Common White (Idaho)

Kersey (England)

Polyplloid (Vermont)

Ladino (Idaho)

White Clover Strain Trial 1954. 1955 Data

Strain	Yield in tons per acre					*Winter kill percentage Range Mean	
	Cut 1	Cut 2	Cut 3	Cut 4	Mean		
West. Composite	0.94	0.78	0.53	0.78	3.03	1-50	20
Iowa ladino	1.06	0.81	0.36	0.51	2.74	2-20	8
Pilgrim-Penn.	0.97	0.78	0.28	0.66	2.69	1-15	6
Oregon ladino	1.03	0.82	0.26	0.55	2.66	2-10	4

Idaho ladino	0.96	0.79	0.31	0.48	2.54	1-3	2
Montana ladino	0.94	0.78	0.32	0.45	2.49	2-40	17
POC3-Quebec	0.93	0.73	0.19	0.56	2.41	0-5	2
Kersey-England	0.94	0.60	0.31	0.47	2.32	2-30	14
Polyploid	0.74	0.60	0.34	0.55	2.23	0-25	10
Morsø-Denmark	0.79	0.62	0.09	0.60	2.10	2-4	3
New Zealand	0.87	0.58	0.23	0.42	2.10	2-10	6
Lodi-Denmark	0.82	0.54	0.19	0.40	1.95	1-8	3
S-100 Aberyst.	0.82	0.59	0.17	0.37	1.95	1-10	3
Commercial	0.85	0.63	0.14	0.33	1.95	1-3	2
Common	0.73	0.60	0.12	0.17	1.62	2-10	4
Pathfinder	0.64	0.50	0.18	0.18	1.50	0	0
Louisiana	—	—	—	—	—	50-90	70
Mean	0.83	0.67	0.26	0.47	2.30		

\* In the main damage was due to ice cover rather than to low temperature. However Louisiana was not winter hardy. Western Composite, California ladino and Kersey suffered more than the average.

Birdsfoot Trefoil

B.E. Twamley

Regional Strain Trials

R.P.O.: F.H. 9-1

Year Initiated: 1953

Seedings were made at Guelph and Kemptville. Stands at the O.A.C. were quite thin and so badly infected with grasses as to be useless for a yield trial. The Kemptville stands were satisfactory and yields were taken that same year and in 1954 and 1955. The results are shown in the accompanying table.

R.P.O.: F.H. 9-2

Year Initiated: 1954

Seedings were made at Guelph, Hespeler and Lynn. Stands were variable. The Guelph plots were cut three times, those at Lynn in June only. The plots at Hespeler established poorly and soon became very weedy. They were not harvested. The results of the Guelph and Lynn cuttings are shown in the tables.

Birdsfoot Trefoil Varieties at Kemptville  
Tons D.M. per Acre. Two Year Average

	<u>Hay</u>	<u>Aftermath</u>	<u>Total</u>
Viking	1.66	1.54	3.20
Empire	1.59	1.50	3.09
European	1.83	1.29	3.12

Observation Plots

These plots seeded on 10A in 1954, were not replicated and neither in 1954 or 1955 received irrigation water. The V-belt was used for seeding and stands were good. Yields taken on some of the rows are shown in the tables.

Some of the characteristics of the varieties are listed below:

Viking - early, upright, medium tall, sturdy, dark green.

French, Italian - early, upright, tall.

Montour - early, upright, medium tall, light green.

Roskilde - medium early, upright, medium tall.

Jokioinen - medium early, upright, tall.

Empire - late, semi-decumbent.

Narrow leaf - late, decumbent.

The four strains of Empire were true to type but strain 360 was somewhat more upright than the others.

Observation Plots - 18C

<u>R.P.O.:</u>	F.H. 9-1	<u>Year Initiated:</u>	1953
<u>Early</u>	<u>Medium-early</u>	<u>Medium</u>	<u>Late</u>
European	Viking	Cascade	Empire
Zoor	Vermont	Granger	Narrow leaf
Guilderland			

New Seeding - Strain Trials

R.P.O.: F.H. 9-3                    Year Initiated: 1955

A variety strain trial was seeded on May 5 in section 16C under a light cover crop of oats. The trial included 10 varieties replicated four times and the design was a randomized block. Irrigation was used and establishment in general was quite satisfactory except in the varieties Empire and Hudson which were rated as fair and poor respectively. A list of varieties follows along with gradings on establishment based on number and vigor of seedlings as of May 30.

<u>Variety</u>	<u>Establishment</u>	<u>Variety</u>	<u>Establishment</u>
Granger	Excellent	Viking	Good to excellent
Italian	"	Zoar	" "
Montour	Good	Roskilde	Fair to good
Guilderland	"	Empire	Fair
French	"	Hudson	Poor

Selections

About 50 plants were selected from 1, 2 and 3 - year old plots. The basis was purely one of vigor and size relative to the neighbouring plants. These were transferred to the greenhouse where studies in self-fertility will be conducted during the winter.

Sweet Clover Strain Trial, 1954

B.E. Twamley

R.P.O.: F.H. 10-12

Year Initiated: 1954

A strain trial was seeded on 17D in 1954. Establishment was poor and only small sample strips were harvested. Some data follow:

<u>Variety</u>	<u>Tons D.M. per acre</u>	<u>Stem Size</u>
Spanish	2.34	very coarse
Common yellow	2.17	medium
Evergreen	2.15	medium coarse
A 46	2.11	medium
S 65	2.10	coarse
Brandon Dwarf	2.09	fine
Madrid	1.89	medium
Erector	1.84	coarse
N 1	1.44	fine
Arctic	--	fine

Miscellaneous Legume Projects

B.E. Twamley

Seeding Date

Alfalfa, red clover, sweet clover and birdsfoot trefoil were seeded on section 1A at two different dates in 1954. Although no yield data were collected in 1955 the plants on the plots seeded in May, 1954, were very considerably more vigorous than those on the plots seeded in August, 1954.

Establishment of Birdsfoot Trefoil by Band-seeding

Stands of birdsfoot trefoil seeded in 1953 and 1954 were unsatisfactory. In 1955 the strain trial was broadcast in the normal fashion. In addition two varieties were band-seeded with a shoeless V-belt on top of 3-24-12 fertilizer drilled in at the rate of 300 lb./acre. Both types of seeding were irrigated and cut back in the same way.

Mulching for Establishment

The addition of straw to broadcast plots of legumes provided superior establishment to that provided by raking alone or by raking followed by the addition of straw. The data indicate that where irrigation is not possible the addition of a straw mulch may assist in the establishment of birdsfoot trefoil.
