Some Practical Advice from 30 Years of Chemical Thinning Research

Steve McArtney
Valent BioSciences LLC

April, 2019
Topics to be covered…

Chemical thinning
- Benefits and importance
- Some underlying physiology that will help you make better decisions
- A unifying hypothesis – carbohydrate balance in the fruit is key
- Why product formulation is so important
- Life without carbaryl
- Putting it all together in a program
- ACC – something new for the future

Promalin
- Programs for fruit size enhancement
- An effective frost rescue treatment
The triple benefits of a successful thinning program

Benefit #1: Increased fruit size and crop value

Fruit size potential is determined within 40-50 days of bloom

A small apple at the end of the cell division phase is going to be a small apple at harvest

The earlier that you can establish the final crop load the larger fruit size will be at harvest
The triple benefits of a successful thinning program

Benefit #2: Reduced hand thinning costs

Hand thinning will normally occur after the cell division phase is finished.

“You can make a big apple small but you can’t make a small apple big!”
The triple benefits of a successful thinning program

Benefit #3: Reduced risk of triggering a biennial bearing cycle

- Initial fruit set
- Initial seed set

Success of chemical thinning program

Other factors:
- Nutrition
- Tree vigor
- ???

Summer NAA and Ethrel programs
Why is light (and heat) important for fruit set?

During the period when thinners are applied, the carbohydrate supply from current photosynthesis is in balance with the demand from the different organs (roots, young shoots, fruit, wood), with the daily balance depending on the amount of sunlight and the temperatures experienced for that day.

A shortage of carbohydrates results in competition between fruit and shoots.

Fruit are weaker sinks than shoots at this time.
CARBOHYDRATE STRESS IN THE FRUIT INTEGRATES THE EFFECTS OF ENVIRONMENT AND CHEMICAL THINNERS ON FRUIT SET
• The fruit cuticle is 2-3 micrometers thick at bloom

• Thickness increases to around 15 micrometers at harvest

Source: Martin Goffinet
Droplet contact area, drying time and penetrants will influence uptake.
WATER-BASED FORMULATIONS CAN HAVE SOLUBILITY PROBLEMS

- Poorly formulated 6-BA product results in crystallization in solution
- Photograph shows 6-BA crystals in a solution of 150ppm
Efficacy of different 6-BA products (PC FRUIT)

Different Sources and Concentrations of 6-BA in Chemical Thinning of Post-flowering in Apple Trees

Gentil Carneiro Gabardo1*, José Luiz Petri2, Aike Anneliese Kretzchmar1, Mariuccia Schlichting de Martin2, André Amarildo Sezerino2 and Willian Coser1

1Santa Catarina State University, Agroveterinary Sciences Center, Lages, Brazil.
2EPAGRI/Cançador Experimental Station, Cançador, Brazil.

BA is efficient in fruit thinning in 'Fuji Suprema' apple trees, being the reduction of fruiting, and increase of fruit size, proportional to the applied concentration. There may be differentiated efficiency of the product by its formulation, even though they have concentrations of active ingredient equivalent. Exilis® was efficient in thinning of apple "Fuji Supreme", when applied to fruit 5 to 10 mm in diameter reduced the need for manual thinning, without causing toxicity. BA can

**Precautions**

Do not apply MaxCel or Cilis Plus in combination with the hormone thinner, NAA (naphthaleneacetic acid), either as a tank-mix or separate sprays during the same growing season. Doing so may result in pygmy fruit.
Can NAA replace Carbaryl in 6-BA mixes?

As a rule of thumb 7.5ppm NAA can replace:

1 pint Carbaryl/100 gal ≈ 7.5 ppm NAA (3oz Fruitone L)

1 L Carbaryl /1000L ≈ 7.5 ppm NAA (200 ml/1000L Fruitone L)

in moderate to hard-to-thin varieties

However, this does not apply for varieties such as Fuji and Red Delicious as pygmy fruit may result.
EXCITING FUTURE FOR PGR’s FROM VBC

1-Aminocyclopropane carboxylic acid (ACC)

- Naturally occurring amino acid.
- Present in all major land plants (fruit, vegetables, grains, nuts, etc.).
- Immediate precursor of the plant hormone ethylene
- VBC holds numerous patents
- VBC has been studying ACC for a variety of commercial applications.
ACC IS A VERY EFFECTIVE LATE APPLE THINNER

3 days after applying ACC to ‘Cameo’ at 19 mm
